

SECTION 5-3: THE FUNDAMENTAL THEOREM OF CALCULUS, PART 1

1. Suppose f is the function whose graph is shown and that $g(x) = \int_0^x f(t) dt$.

(a) Find the values of $g(0)$, $g(1)$, $g(2)$, $g(3)$, $g(4)$, $g(5)$, and $g(6)$. Then, sketch a rough graph of g .

Sketch of $g(x)$

- (i) Where is $g(x)$ increasing? $(0, 3) \cup (5, 6)$
 (ii) Describe f when $g(x)$ is increasing. positive
 (iii) Where is $g(x)$ decreasing? $(3, 5)$
 (iv) Describe f when $g(x)$ is decreasing. negative
 (v) Where does $g(x)$ have a local maximum? $x=3$
 (vi) Describe f when $g(x)$ has a local max. $f(x)=0$ and f goes from $+$ to $-$
 (vii) Where does $g(x)$ have a local minimum? $x=5$
 (viii) Describe f when $g(x)$ has a local min. $f(x)=0$ and f goes from $-$ to $+$
- (b) Make a guess: what is the relationship between $g(x)$ and $f(x)$?

$$f(x) = g'(x)$$

The Fundamental Theorem of Calculus, Part 1 If f is continuous on $[a, b]$, the function g defined by

$$g(x) = \int_a^x f(t) dt \quad a \leq x \leq b$$

is continuous on $[a, b]$ and differentiable on (a, b) and $g'(x) = f(x)$.

2. Find the derivative of $g(x) = \int_2^x t^2 dt$.

$$g'(x) = x^2 \quad \leftarrow \text{careful of your variable name!}$$

3. The Fresnel function $S(x) = \int_0^x \sin(\pi t^2/2) dt$ first appeared in Fresnel's theory of the diffraction of light waves. Recently it was applied to the design of highways. Find the derivative of the Fresnel function.

$$S'(x) = \sin\left(\frac{\pi x^2}{2}\right)$$

4. Consider $g(x) = \int_1^{x^4} \sec t dt$.

Let $u = x^4$ and $h(x) = \int_1^x \sec t dt$.

- (a) Write $g(x)$ as a composition.

$$u = x^4, \text{ so}$$

$$g(x) = h(u(x)).$$

Note $h'(u) = \sec(u)$
by FTC 1.

- (b) Use FTC1 and the chain rule to differentiate $g(x)$.

$$\text{So}$$

$$g'(x) = h'(u) \cdot \frac{du}{dx}$$

$$= \sec(x^4) \cdot 4x^3$$

5. Consider $g(x) = \int_{2x+1}^2 \sqrt{t} dt$.

- (a) Write $g(x)$ as a composition.

$$u = 2x+1, h(u) = -\int_2^u \sqrt{t} dt$$

$$\text{So } g(x) = h(u(x))$$

Notice we flipped the integral when defining h because FTC 1 says if $g(x) = \int_a^x f(t) dt$ then $g'(x) = f(x)$.

- (b) Use FTC1 and the chain rule to differentiate $g(x)$.

$$\text{So } g(x) = h(u(x)) \text{ and}$$

$$g'(x) = h'(u) \cdot \frac{du}{dx}$$

$$= (-\sqrt{2x+1})(2)$$

6. Consider the function $g(x) = \int_{\tan x}^{x^2} \frac{1}{\sqrt{2+t^4}} dt$. Observe that

$$\int_{\tan x}^{x^2} \frac{1}{\sqrt{2+t^4}} dt = \int_{\tan x}^0 \frac{1}{\sqrt{2+t^4}} dt + \int_0^{x^2} \frac{1}{\sqrt{2+t^4}} dt.$$

Use properties of definite integrals, FTC1, and the chain rule to determine $g'(x)$.

$$g'(x) = -\int_0^{\tan x} \frac{1}{\sqrt{2+t^4}} dt + \int_0^{x^2} \frac{1}{\sqrt{2+t^4}} dt$$

$$= -\frac{1}{\sqrt{2+x^4}} (\sec(x))^2 + \frac{1}{\sqrt{2+x^4}} (2x) = \frac{1}{\sqrt{2+x^4}} (2x - (\sec(x))^2).$$
